MATHS LESSON NOTES

FOR P.4

TERM TWO

WEEK TWO

LESSON ONE.

FRACTIONS

Definition:

A fraction is part of a whole.

Numerator and denominator

The numerator is a digit on top or above the bar.

The denominator is a digit below or under the bar.

e.g. $\frac{2}{3}$ \rightarrow Numerator
 \rightarrow Denominator

The numerator tells us the number of parts we have taken while the denominator tells us the number of parts of equal size the object is divided into.

Fraction	Numerator	Denominator
$\frac{1}{3}$	1	3
$\frac{2}{5}$	2	5

WEEK TWO
LESSON TWO.

Shading and describing shaded parts.

Shaded fraction = $\frac{\text{Number of shaded parts}}{\text{Number of parts}}$

$$= \frac{3}{8}$$

Unshaded fraction = $\frac{\text{Number of unshaded parts}}{\text{Number of parts}}$

$$= \frac{5}{8}$$

Example:

Write the shaded fraction in the figure.

Solution: The figure must be divided
In to equal parts.

$$= \frac{1}{4}$$

Shade $\frac{1}{3}$

$\frac{1}{3}$ of 6 parts

3

$$= 6 \text{ parts} \div 3 \times 1$$

$$= 2 \text{ parts} \times 1$$

$$= 2 \text{ parts}$$

WEEK TWO

LESSON THREE.

TYPES OF FRACTION

Proper fractions

A fraction whose numerator is less than its denominator.

e.g. $\frac{2}{5}$, $\frac{1}{6}$, $\frac{12}{34}$, $\frac{100}{126}$, e.t.c.

Improper fractions

It is a fraction whose numerator is bigger than the denominator.

e.g. $\frac{3}{2}$, $\frac{12}{5}$, $\frac{17}{12}$ e.t.c.

Mixed fractions

Is a fraction with a whole number and a common or proper fraction.

e.g., $1\frac{1}{2}$, $10\frac{1}{8}$, $3\frac{4}{5}$, e.t.c.

WEEK TWO

LESSON FOUR.

Changing mixed fractions into improper fractions:

Mixed fraction: $4\frac{2}{3}$

4 - Whole number
2 - Numerator
3 - Denominator

$$\frac{(\text{Denominator} \times \text{whole number}) + \text{Numerator}}{\text{Denominator}}$$

$$\begin{aligned}\frac{(d \times w) + n}{d} &= \frac{(3 \times 4) + 2}{3} \\ &= \frac{12 + 2}{3} \\ &= \frac{14}{3}\end{aligned}$$

Change $5\frac{2}{3}$ into an improper fraction.

$$\begin{aligned}5\frac{2}{3} &= \frac{(3 \times 5) + 2}{3} \\&= \frac{15 + 2}{3} \\&= \frac{17}{3}\end{aligned}$$

REF: - Learning MTC bk 4 pg 27
- MK Bk 4 pg 91

WEEK TWO

LESSON FIVE.

Changing Improper fractions into mixed fractions.

Examples:

1. Change $\frac{3}{2}$ into a mixed fraction.

$$3 \div 2 = 1 \text{ rem. } 1$$

$$\text{Therefore, } \frac{3}{2} = 1\frac{1}{2}$$

Equivalent fractions

These are fractions which have the same value when simplified.

e.g.

$\frac{1}{2}$

$\frac{2}{4}$

$\frac{4}{8}$

N.B. All the shaded parts are equal.

\therefore The equivalent fractions for $\frac{1}{2}$ are $\frac{2}{4}$, $\frac{4}{8}$, e.t.c.

Reducing fractions to their lowest terms.

Equivalent fractions can also be made by dividing the numerator by the same number (G.C.F.).

N.B. When there is no whole number which can be divided exactly into the numerator and denominator then the fraction is in its lowest terms.

1. Reduce 4/6 to its lowest terms.

$$\frac{4}{6} \div \frac{2}{2} = \frac{2}{3}$$

2. Reduce 9/18 to its simplest form.

$$\frac{9}{18} \div \frac{9}{9} = \frac{1}{2}$$
